is given in terms of a reduction relation between *configurations*, multi-sets of  $\lambda_{cv}$ c osed express ons or programs. Unfortunately this operational seemant cs is not co positional, in that the behaviour of a  $\lambda_{cv}$  expression or indeed configuration s not determined by that of its constituents.

Here we give a compositional operational semantics in terms of a labelled transition system for *µCML* programs. The evaluation system for *µCML* programs. This not only describes the evaluation steps of programs, as  $n \geq 30$ , but also the incommunication potentials, in terms of t e r ab ty to nput and output values along communication channels.

e t en proceed to de onstrate t e usefulness of t s compositional operat ona se ant cs by using t to deine a version of *weak observational equivalence*  $\triangle$  suitable for *µ*CML eprove that, odulo the usual problems associated with the choice operator of CC our chosen equivalence is preserved by a μCML contexts and therefore ay be used as the basis for reasoning about CML programs. In this paper we do not investigate in detail the resulting theory but conne ourselves to pointing out some of its salient features for example standard dent t es one would expect of a call-by-value  $\lambda$  calculus are given and o d we also show that certain algebraic laws common to process algebras.  $\mathbb{R}$ 

e now exp a n n ore detate contents of the remainder of the paper.

IN  $EC^{\blacksquare}$  ION 2 we describe the language  $\mu$ CML a subset of CML. It is a typed anguage, with base types for channel names, booleans and integers, and type constructors for pairs, functions and delayed computations; these last are called Event types. It has the standard constructs and constants associated with the base types and with pairs and functions. In add tion it has a selection of the CML constructs and constants for an pu at ng de ayed co putations spawn gener-

## **5 Properties of Weak Bisimulation**

In this sect on, we show some results about program equivalence up to ered tary wea bs u at on o e of t ese equivalences are easy to some but so e are trickier, and require properties about the transition systems generated by  $\mu$ CML<sup>+</sup>. A toughtuch remains to be done on elaborating the algebraic theory of  $\mu$ CML programs we ope that the results in this section indicate that this equivalence can for the basis of a useful theory which generalises those associated with process a gebras and funct onal programming.

e ave given an operational semantics to  $\mu$ CML by extending twith new constructs  $\bullet$  ost of w c correspond to constructs found in standard process a gebras. These include a c o ce operator  $\bullet$  parallel operator and suitable versions of input and output prefixing,  $\mathbb{R}$  e prefixes in  $\mu$ CML<sup>cv</sup> ave a s g t y unusual syntax t e r equivalents in CC are given as

e now exame the extent to which and act like choice and parallel operators from a process a gebras

e can nd b s u at ons for t e following and lence they are sensitive  $\mathbf{b}$  s ar

$$
\begin{array}{cccccc}\n & \Lambda & e & e \\
(e & e_2) & e & e & (e_2 & e) \\
(e & e_2) & e & (e_2 & e) & e\n\end{array}
$$

**T** us sat s es any of t e standard aws associated with a parallel operator in a process a gebra. However t s not n general symmetric because of ts interact on w t t e product on of values

*v <sup>e</sup> <sup>e</sup>*

For exa p e

 $\Box$ 

Λ <sup>Λ</sup> <sup>Λ</sup>

s eans t at we can vew t e parallel composition of processes as being of t e for

 $\left(\left\|\left(e_i\right)\right\|f\right)$ 

were the order of the  $e_i$  is unifferent. Note that it *is* important which is the rgt ost express on na parallel composition, since the state and read of co putation and so can return a value w c none of t e ot er expressions can

computation, and so can return a value, which none of the other expressions can. The choice operator of  $\mu$ CML<sup>+</sup> also satisfies the expected laws from process a gebras, those of a commutative monoid, although it can only be applied to guarded express ons

$$
\begin{matrix} \Lambda & ge & ge \\ (ge & ge_2) & ge & ge & (ge_2 & ge) \\ ge & ge_2 & ge_2 & ge & \end{matrix}
$$

**The search sum of guarded expressions as being of the sum of guarded expressions as being of the sum of the sum of guarded expressions as being of the set of the set** for

where the order of the  $ge_i$  is unimportant.

In fact guarded express ons can be vewed n a anner quite s are to the e can *sum forms* used in the development of the algebraic theory of CCS  $\quad \&$  example.  $f{nd }$  b s u at ons for the following and hence they are sensitive b s are sensitive bigimum and hence they are sensitive bigimum and hence they are sensitive big and hence they are sensitive bigger and hence they are sen

$$
\begin{array}{cccc}\n(ge & ge_2) & v & (ge & v) & (ge_2 & v) \\
ge & \text{fn } x & x & s & ge \\
\text{A}v & ^s\text{A}() & \text{fn } x & v\n\end{array}
$$

Frot s we can so w by structural induction on that all guarded expressions are of a g ven for

$$
ge \int_{i}^{s} \bigoplus_{i} ge_{i} \quad v_{i}
$$

we eac  $ge_i$  seter  $k_i$   $v_i$   $k_i$  or  $\mathbf{A}()$ . Front s and

$$
c\nu \delta(c,\nu)
$$

we can sow that all values *v A*event are of the form

*vn* choose[wrap(*<sup>e</sup>* , *<sup>v</sup>* ),...,wrap(*<sup>e</sup>n*, *<sup>v</sup>n*)]

where  $e_n$  is either transmit $(k_i, v_i)$  receive  $k_i$  or always().

e could continue in this anner equating the algebraic theory of CC for example with expansion theorems for guarded expressions or values of event type. However we eave t s for future wor

e now turn our attent on to  $\mu$ 

 $λ<sub>cv</sub>$  express ons Instead of ut sets we use *configurations* of *µCML<sup>cv</sup>* express ons g ven by t e grammar

$$
C \quad Conf = e \mid C \quad C \mid \Lambda
$$

Note that configurations are restricted forms of  $\mu$ CML<sup>+</sup> expressions. This will facilitate the comparison between the two semantics since it can be carried out for congurations rate of the  $\mu$ CML express ons

 $\int_{\text{e}}^{\text{on}} \text{gurt on s rat er t}$  and  $\mu$ CML expressions.<br>  $\text{e se ant cs of } \blacktriangle$  is expressed as a reduction relation = gurations and reductions are four independent sources.  $\overline{a}$  existinvolves a sequent a reduction with an individual  $\mu$ CML expression and this in turn is de ned using another reduction relation  $-$  + the second is the spawning of new *computation threads* w c results in an increase in the number of components of the conjuncturation that the third is communication between two expressions and the ast srequired to and ete always constructees need notation for each of these

and we consider them in turn.<br>The operational rules for sequential reduction are defined *in context* in the style of rg t and Felleisen  $\Box$  and the contexts that permit reduction are g ven by t e following grammar

 $E = [\cdot] | E e | v E | c E | (E, e) | (v, E) |$  let  $x = E$  in  $e |$  if  $E$  then  $e$  else  $e$ 

The relation  $-$  is defined to be the least relation satisfying the following rules:

$$
E[cv] - E[\delta(cv)] \quad (c \quad \text{Spawn, sync}) \quad \underline{\text{const}} \\
E[(\text{fix}(x = \text{fn } y \quad e))v] - E[e[\text{fix}(x = \text{fn } y \quad e)/x][v/y]] \quad \underline{\text{beta}} \\
E[\text{let } x = v \text{ in } e] - E[e[v/x]] \\
E[(v, w)] - E[v, w]
$$

Here each rule corresponds to a basic computation step in a sequent a call-byvalue anguage es ou d point out that the last rule does not appear in  $\blacksquare$  it is

p c t n eppy s state ent t e syntactic class of t e term  $(v, v_2)$  is either *Exp* or *Val* t s a b gu ty s resolved in favour of *Val*. " e ave ade t e grammar una b guous and ave added an exp c t reduct on rule for resolving a b gu ty

Note that the definition of  $\overline{z}$  and the reductions of an express on are not defined in terms of the reductions of the subsequences ons express on are not defined in terms of the reductions of its sub-expressions. following Lehra will be useful in later proofs and shows that we can recover co post onaly
